Nanotechnology is moving closer to our daily life. Researchers from the University of New South Wales, Australia, are developing a coating that may make cleaning bathrooms 41 of a chore. The leading researchers, Professors Rose Amal and Michael Brungs, are hoping to apply a tiny coating of titanium dioxide to keep the toilets clean. Currently titanium dioxide is being used on outdoor items 42 self-cleaning windows.

To further keep the bathroom clean, nanoparticles kill the germs and remove organic compounds. 43, the coating prevents liquid droplets from forming on the surface. It makes the liquid run off, 44 the toilet in the process.

Exciting as this research project is, at this time it is currently only in development. The researchers 45 it will take about a year before it can be seen on the market. It would certainly be great to have a clean bathroom that would clean itself.

The tower of Pisa is the bell tower of the cathedral of Pisa in Tuscany, Italy. It leans because when the building was half completed, the soil under one half of the circular structure began to subside and the tower tipped.

Work on the tower was begun in 1173, but was discontinued for a century after the subsidence. However, in 1275, architects devised a plan to compensate for the tilt. Two stories, the third and the fifth, were built out of line with the others and closer to the vertical in an effort to alter the tower's center of gravity.

But the leaning has continued to increase gradually throughout the centuries. Pumping to keep water away from the surrounding ground and the injection of cement grout into the foundations and the surrounding subsoil have been tried in recent years, but without success.

The tower, which is one of the most unusual in existence, is Romanesque in style and made of white marble. It is cylindrical in shape and has eight stories.

The tilt is about 17 feet, or more than five degrees, from the perpendicular. The tower continues to increase its tilt by about a quarter of an inch each year.
